Im Ganzen 360 Gattungen und 2288 Arten.

Verbesserungen.

Der Verfassersname „Eecke“ ist leider wiederholt „Eeecke“ gedruckt worden.

p. 594 soll es „Hypagoptera“ statt „Hyrapogoptera“ heißen.

p. 664 unter „Neoseaptia“ figuriert eine Art „collaris Hamps.“, die „collateralis“ heißen sollte.

p. 647 ist „Garudinodes recurviloba Rothsch.“ zu streichen. Das ♂ ist eine *Megalobosia*, das ♀ eine *Halone*.

p. 586. „Eilema transfasciata Rothsch.“ ist nach Hampson in: Cat. Lep. Phal. Br. Mus. Suppl. 1. p. 627, t. 33, f. 17—18 (1914) eine *Chionaema*.
